
Subject: Compiling errors

I have a procedure where i use a self written function in. If I compile the procedure and then type in the command line the following:

```
.reset_session  
resolve_all
```

all dependent functions are compiled. Then if i try to run the procedure I get an error on the line where i use the self written function:

```
% Keyword parameters not allowed in call.
```

I've rewritten the function some time ago with different input parameters as a result. If I then compile the self written function manually, everything works.

What seems to be the problem here? Am I doing something wrong here, apart for rewriting the function.

Also, if I use 'resolve_all' with IDL + ENVI on, i get alot of errors, with being the first:

```
% Attempt to call undefined procedure/function: 'ADAPT_FILT_EVENT'.
```

What am I doing wrong?
