Here's one possible commercial alternative:
If the Mac running IDL is running the Server version of OS X, you
might be able to use Aqua Connect
  http://www.aquaconnect.net/index.php
to serve Mac OS X to "thin clients" on any platform. It's different
than VPN/Timbuktu/Apple Remote Desktop/etc. because the different
users will *not* be sharing the same screen when both are logged in. I
saw a demo of this program in action that was able to run on an iPhone
(in addition to Windows, Linux, and Other Macs). One mode of this
scheme is that an application, like a word processor, can be running
just one time in memory, but multiple users would be using their own
unique windows of the application.
  Since I haven't used the program, I can't comment beyond the demo I
saw.
