Hi Folks,

I am installing idl on ubuntu 8.10. The command line program works correctly for the 64 bits in memory. However the idlde workbench does not. Has anyone faced this before? I contacted the support on the itt company and seems that idlde was build by 32 machines only.

This will show up if you type

help, !version, /structure

and it will show if it has 32 or 64 bits for managing the memory.

Giorgio
