Folks,

I have been trying to use the IDL Export Bridge Assistant (IDLexbr_Assistant) to write a JAVA wrapper for an IDL object I have written.

Depending upon which machine I am on, I can or cannot open the same identical file (just transferred from a Windows machine to a UNIX machine in the normal way I transfer all such files). Another object file, which I transferred in the same way can be opened correctly on both machines. (Both running IDL 7.0.3.)

When the program fails to open the file it complains that "the IDL source object cannot be resolved".

Has anyone seen this kind of problem before? Does anyone have any ideas as to what the problem might be?

The file in question does NOT open on my Windows machine (where it was created), but DOES open on my LINUX machine (which is where I have transferred it).

Both files are Catalyst objects, and the Catalyst Library is on the IDL path in both machines.

As an aside, I have another, extremely simple helloworld__define.pro file that I copied from the documentation. I can open this file on both my machines, but when my colleague, who uses an identical LINUX machine, opens the file he sees absolutely nothing and gets no error message. What's up with that!?

Cheers,

David
