Maybe I misunderstood the original problem. I ran the following IDL code on a workstation:

```
a = dist(200)
tvsc1, a
xloadct
```

When I switch the lookup table in xloadct both the color bar in the xloadct widget and window 0 are updated simultaneously. No need to move the mouse into window 0.

I use HCL eXceed as X Server on my PC. I had such a problem you described with HCL eXceed several versions ago. But this was fixed between eXceed version 3.2 and 3.3.3. Now I have version 5.0.1 installed...

To have the lookup table updated instantly on the PC the X Server should allocate a so called private color table.

Hope this helps
Norbert
