
Subject: implementation of geotiff keys

Hello,

In order to be able to write large geotiff (i.e. without using WRITE_TIFF which has to load the data), I have recycled the "obsolete" procedure TIFF_WRITE.pro (still distributed with IDL). Presently I can write large tiff files of float data without having to load the whole dataset in memory.

Now I would like to write some geotiff tags and keys to my tiff file, but I cannot figure out clearly how to proceed. Has anyone an example of code showing how to pass parameters and manage the offsets when writing the geotiff keys/tags?

Thank you

Marc
