Hi,

During the transition from PV-WAVE v4.02 to PV-WAVE CL Version 6.01 + Navigator we seem to have lost some functionality while importing ASCII data.

Using PV-WAVE v4.02 it was possible to preview/import an ASCII file containing data such as:

```
VarName1 VarName2 VarName3  
0.15 0.16 0.17  
0.18 0.19 0.20
```

after which PV-WAVE knew the names of the variables from the header line.

The problem is that I can't get PV-WAVE CL Version 6.01 + Navigator to do the same. It is possible to, manually, define the names of the variables while previewing an ASCII file, but that's tedious work. Can somebody help me to automatically derive the names of the variables from the header line?

Thanks in advance,

Rudi
