I would check to make sure that the first argument to ENVI_INIT_TILE is supplied correctly. You should be giving it the FID of the input file, but the "output_DSM" doesn't sound like an input FID to me. In fact, since you use it as an argument to TRI_SURF it looks like output_DSM has to be an actual data array. So i think you're giving ENVI_INIT_TILE an incorrect argument.
