Hi,

The IDL7 workbench is a real setback for me, but I guess its adapt or die (or switch to python).

I'm starting with a simple task by converting all my gui .prc files to workable .pro files. I understand many people on this groups despised the old gui builder, but I loved not wasting time writing tedious building code for constructing guis.

Thanks to this group, I've managed to configure the workbench into something that doesn't occupy an unusable amount of screen real estate, but theres one major irritation that I can't seem to find an answer to:

Is it possible to turn hover help off? Unless I'm careful to place the mouse somewhere safe, I constantly get yellow pop-up boxes distracting my attention and blocking the screen with information I don't need.

Normally I'd blame myself, but this workbench has so many annoying quirks it would not surprise me if in fact hover help couldn't be eliminated.

Thanks

Harry
