
Subject: ENVI_INIT_TILE tiling problem

I'm using interpolation to fill some holes in elevation data. Because of memory limitations I'm trying Envi's tiling capability for the first time! My code compiles OK, but when I run it (I have it embedded in an Envi User Function) I get this error in my IDL window:

```
% Variable is undefined: F_NS.  
% Execution halted at: ENVI_INIT_TILE
```

Here is the offending section of code. I have no idea where F_NS is (I'd understand if it was simply NS, i.e. number of samples) and despite searching I cannot deduce what is wrong or how to fix it. Does anyone have any ideas?? BTW, the elevation data has a single band and my_pos is set to [0].

```
tile_id=ENVI_INIT_TILE(output_DSM, my_pos)  
FOR i=0, num_tiles-1 DO BEGIN  
    tile_data_interp=ENVI_GET_TILE(tile_id, i)
```

;Processing within Tiling

```
tile_data_interp = REPLICATE(0.0, dims[2], dims[4])  
tile_data_interp = TRI_SURF(output_DSM, /REGULAR, XGRID=[1, 1],  
YGRID=[1, 1], NX=dims[2], NY=dims[4])
```

; Close Tiling

ENDFOR

ENVI_TILE_DONE, tile_id
