Greetings,

I have two 2D arrays I would like to regress. Both were created with the variance command and are `intarr(673,274)`. Does one of these need to be a vector? Both need to be a vector? If so, is there a way to convert them from an array to a vector? I watched someone do this very quickly yesterday, but can not remember how.

I thought this would be quite simple, but I haven't done a regression in IDL before and am hoping I can figure it out.

Thanks!
