RETURNing anonymous structures is a handy way to pass back results with mixed types. As in:

```
function do_this, x
result = {timestamp: systime(), $
           mean: mean(x), $
           min: min(x), $
           value:some_other_calculation_using_x(x) $}
return(result)
end

foo = do_this(x)
print, foo.timestamp
print, foo.mean
print, foo.min
print, foo.value
```

Regards, Mike
