Subject: screwy system variables !? Posted by trujillo on Thu, 25 Jul 1996 07:00:00 GMT

When I try to compile/run it, I get the following error (unless I manually define !tester at the command line first):

> % Not a legal system variable: !TESTER.

Now, I change the program to

- > pro tester
- > defsysv, "!tester", 222
- > help, /system_variables ;this line indirectly tells me about !tester
- > end

And it compiles and runs fine, and output suggests that the global variable has been created: "!TESTER = 222". What the heck is going on? Is this a bug? Why can't I use a system variable I have just defined later in the same program? I'm using IDL version 4.0.1. Maybe I should give up and use a more rational language like C/C++!
