I have a file with a bunch of numbers stored in it, formatted. It looks something like this:

```
2555 3456 4567 5678 6789 7890
```

```
2345 6788 3445 6778 8899 9900
```

```
..
```

```
..
```

```
..
```

I am having trouble finding a procedure that will count the number of elements in this file, so that when I create an array into which to read this file, I will know what size to make the array.

Any suggestions?

Gadi
