We are going to acquire a compute server for our lab which will support IDL.

We have some fairly large, but parallizable problems so we are looking at 64-bit systems. Currently, we are considering a system using 4 Xeon 6-core processors under Linux or Windows server. We might also consider Sun

Does anyone have experience that would indicate that IDL 7 runs better or with fewer problems on one or the other?

I don't want to start an OS war. I use both Linux and Windows and suffer equally with both.
