
Subject: IDL 7.0 (Windows version) - widget_table does not generate expected event

I would like to have widget_table generate an insert character event without changing the contents of the widget. Keyword ALL_EVENTS is set, but the event handler is not called. Here is a simple test:

```
pro table_eh, event
  print, 'event'
end
```

```
pro test
  tlb_id = widget_base()
  base_id = widget_base(tlb_id)

  data = [[indgen(5)],[indgen(5)]]
  table_id = widget_table(base_id, VALUE=data, /ALL_EVENTS, $
    EVENT_PRO='table_eh')

  widget_control, tlb_id, /REALIZE
  xmanager, 'gui', tlb_id
end
```

I tested this program with IDL 6.4 (Linux version) and it behaves as expected. The help page for widget_table does not mention any changes in IDL 7.0. What am I missing?

Thanks for your attention

Bernd
