Hi folks,

I've a simple question about IDLgrViews: Is it possible to draw 2 views, or more, at the same time ?

I think this is not possible but I'll not be surprised if somebody tells me how to do that.

If I've an interface, normally, I program an interface_controller who takes the control of the interface. Then I've a method to draw the view and I do something like that:

```
self.model_A->draw, self.view_A  
self.model_B->draw, self.view_B
```

....

So, using this code the interaction is not nice because there is a delay drawing the different parts of the interface.

Any ideas? Is it possible to draw all the parts at the same time ?

Thanks,

Bernat
