I.S.P. is planning another Expert Systems training seminar August 19-23, 1996. I.S.P. is located in Houston, Texas and primarily offers seminars in Houston. Seminar can also be held at a client site when requested.

This class will emphasize techniques, syntax, and a depth that is not covered in a general education class. It has been designed to teach by examples and case based reasoning. Attendees do not need to be the best or the worst programmer, but rather have a strong background in computer science or a recent c.s. degree. Those who usually do not program symbolically may feel uncomfortable at first; this is expected. However, the pieces will begin to fit together by the second or third day. This course is not a "cake walk" - it is hands on training in rule based programming; it is intense; it is hard work.

The students will develop several small Expert Systems. These exercises are chosen from problem domains that everyone can relate to. We don't want students to have to spend time learning the problem domain, we would rather you maximize your time learning the rule based programming techniques.

If you wish to find out more information regarding training schedules, topics, registration, etc., please send email or call our office.

Sincerely,

K. Mayfield, PhD.
