Subject: [Q/HELP] Using the Z-buffer

There isn't really much in depth discussion in the IDL manuals (including on-line help and the Training manuals) about using the Z buffer to perform hidden line removal.

What I would like to do is something similar to the example of the vector cube within the training manual, but create a vector sphere instead (which i will later have to upgrade to an oblate sphere as I want to use it to represent a planetary body, and perhaps wrap actual image data onto it).

Does anybody have code for creating more complex vector objects than the simple cube, using the Z-buffer to remove hidden lines?

It may be that what I need is some more decription of how Z-buffers work in general and how 3D objects should be specified, so if anybody knows of a useful reference on the subject outside of IDL, that would also be helpful.

Thanks

Tim Patterson
