Like I said, I have XQuartz installed, I just didn't know if it could coexist with the original Apple X11.....For the record, IDL is using XQuartz (the XQuartz icon pops up when I use IDL when physically sitting at the computer) and I have the most recent version installed (installed after the update to 10.5.7). I guess something could have been reset or modified during that update, maybe it isn't the apple update but rather the XQuartz update causing the problems. Obviously X11 forwarding is still allowed otherwise I couldn't run xterm or xclock. Could IDL be looking in the wrong place for X and that's why I can open X windows from the terminal but not from inside IDL? I'm relatively new to IDL (only been using it for a couple of months) so I'm not sure how to investigate IDL specific problems.

Thanks for any help.

Craig
