IDLdoc 3.2 has been released! Head over to idldoc.idldev.com or
automatically update with the Workbench update mechanism. Whatï¿½s new in
IDLdoc 3.2 follows:

   1. Added ability to create LaTeX output. Use the TEMPLATE_PREFIX
keyword to the IDLDOC command to specify that the LaTeX templates should
be used and the COMMENT_STYLE keyword to specify that markup in comments
in the source code should be converted to LaTeX in the output:

   idldoc, ..., template_prefix='latex-', comment_style='latex'

IDLdoc is now completely setup for users to generate documentation in
any text-based format they want.

   2. Added ability to create documentation for DLM files. IDLdoc will
automatically find .dlm files in the ROOT subdirectories and create
documentation for them. No special comments in the .dlm file are
necessary (or used).

   3. Added INDEX_LEVEL keyword to IDLDOC command to control the
granularity of the index: 0 for no index; 1 for directories, classes,
files, and routines; 2 for level 1 items plus parameters, keywords,
fields, properties, and sav file variables

   4. Adds links to names of routines and classes found in the Uses
section for routines and files.

   5. Added color output in the output log for errors and warnings if
the COLOR_OUTPUTLOG keyword is set or if the MG_TERMISTTY routine is
present and returns true.

   6. Miscellaneous small bug fixes.
