This should not be a difficult thing. But I don't know how to do it.

I want to plot two images (2-d bytarr) in one window. The background is black. Thus one image should be in white color while another one is in red color. I know how to load the color table.

The routine I use to plot image is tv or tvscl.

If you just to plot the line, you can say: plot, x, y, color=color.

Is there the similiar thing for plotting 2-d image?

Thanks a lot.

Yafeng
