To sum up :

I have to link the event `tlb_kill_request_events` with the function `close_window.pro` and the event `kbrd_focus_events` with the function `test_window.pro` (this function gives me the number of the window) so I tried :

```
tlb = widget_base(title="mywindow", MBAR=mbar, /col, $
                /tlb_kill_request_events, event_pro=close_window, $
                /kbrd_focus_events, event_pro='test_window')
```

but the software crashes.

If I just do :

```
tlb = widget_base(title="mywindow", MBAR=mbar, /col, $
                /kbrd_focus_events, event_pro='test_window')
```

the software obviously doesn't link the will to destroy the widget with the top right cross button with the function `close_window` anymore.

I tried to create parent and child structure :

```
tlb0 = widget_base(title="mywindow", $
                /tlb_kill_request_events, event_pro=close_window)
tlb = widget_base(GROUP_LEADER=tlb0, $
                MBAR=mbar, /col, $
                /kbrd_focus_events, event_pro='test_window')
```

but, one more time, IDL only considers the second key word and doesn't link the will to destroy the widget with the top right cross button with the function `close_window`.

So what could I do to link with this `widget_base` both events ?

Thank you for advance

Cheers

Jeanphi
