i faced with problem. trying to do some application for touchscreen
(sensor screen)

I have API for my touchscreen. It's use C programming language. But i
still think...
how i can connect this API to IDL iTools or any my IDL program or ENVI
software ??? :((
i don't have another ideas except trying create new iTool. May be
something with C API ? CALL_EXTERNAL or DLM modules ?

my multitouch device allow user touch two fingers to it and move
fingers simultaneously. I think it's not like left and right button on
mouse simultaneously :(((. IDL haven't any events for it :(

i think IDL API closed for me that i can to do new value for "press"
field in event structure. Or not ?
If not, then how i can add new value ? :)

Thanks for your help
