Subject: IDL 7.1  segmentation fault on exit
Posted by JJ on Thu, 09 Jul 2009 20:38:11 GMT

I just found another seg-fault error in IDL 7.1.

This is on a 64 bit linux platform running CentOS 5.3

The segmentation fault only occurs when I type exit in IDL, so it's
not so critical, but it's troubling.  It only happens if during the
IDL session, I have opened a window on a remote X server.  It doesn't
seem to happen when I am running and displaying IDL windows locally.
I often ssh into more powerful machines from my mac laptop and display
back to my laptop screen - this is when I get the problem.

```
>  uname -a
Linux *** 2.6.18-128.1.14.el5 #1 SMP Wed Jun 17 06:38:05 EDT 2009
x86_64 x86_64 x86_64 GNU/Linux
>  idl
IDL Version 7.1 (linux x86_64 m64). (c) 2009, ITT Visual Information
Solutions

IDL> window
IDL> exit
Segmentation fault
```

I do not see the same problem in IDL 7.1 on my 64 bit Solaris i86
platform.

Anyone else see a similar problem?

Thanks.
