Hi everyone, uhm it's the first time I use this page to ask something, so I don't if my question will be too long for an answer, but anyway if anyone can help me with just a anything, I would appreciate so much. The things is, I'm starting with IDL so I'm a little bit lost. Could anyone tell how can I apply a multiple linear regression function to procedure that read an ascii file that contains five columns (id of meteorology station, temperature, latitude, longitude and altitude) and 3 rows of numbers. I was able to open and read the file but I can't "connect" the function and the procedure, and I'm losing my ideas :(. So, if anyone can help, that would be great. Thank you.

Lucas
