Hi Marshall,

Two comments:

- First of all, you are creating and destroying your bridges in each FOR loop. Why? You can simply reuse your IDLbridge to do the next batch of computations. Maybe you run into some kind of internal IDL limit that limits the number of IDLbridges you can create and destroy in a single session.

- Two, you might be interested in the `process_manager` I wrote which was designed to handle exactly this kind of stuff. Let me know, the thing is not very well tested so it could also benefit from someone trying to use it.

with best regards,

Allard
