In my program, there is a main widget which has "button1". each time "button1" is pressed, a relevant file opens and according to the data values in that file, a curve is plotted (actually Oplotted) on the draw window. For each curve, there exists a "remove button". Now I want to remove the relevant curve (plot) , whenever "remove button" is clicked.

As far as I know if I use iplot, each time a curve is plotted, it would be a new popup window. I don't know how to appear that window in my GUI. and by the way I didn't understand "Draw the plot over without that curve in it".

Thank you
Afra
