Hi, all.

There is a method to create a transparent polygen in David's website.

[http://www.dfanning.com/code\\_tips/transpoly.html](http://www.dfanning.com/code_tips/transpoly.html)

But it seems that it does not work on the PS device.

Is there anyone who can give me a simple example of creating a  
transparent shadow on the PS device?

Best regards,

jdu
