Subject: closing tabs of widget_tab()
Posted by b.a on Thu, 06 Aug 2009 06:21:57 GMT

Hi,

I have a widget_tab in my program and by user request (clicking on a
button), new tab can be added to the widget. I also need to destroy
the tabs in some way (each tab which is added has a close button on
it. I want to destroy the tab when its close button is clicked.). As
all the tabs on the widget have the same ID, I can't just use its id
to destroy it. Is there any other way?
I can also get the index of the tabs but that doesn't help.

Cheers
Afra
