Subject: String Array to 'regular' array?

Ok so here's the current issue. I created an average of a few images
the other day, and saved the images as an .isv file. I went to use
it, and realized I can't use half of the image because the numbers are
zeros. So I tried to just take a few rows of the image, and I get an
error every time. The image is a 1024x1024 image. But I get an error
that says:

% Attempt to subscript MF with <INT   (123)> is out of range.
% Execution halted at: $MAIN$

(after I had input IDL> read2=mf[123,123])

Is there a way to fix this or do I have to re-average the images? And
if that's the case, how do I save it next time so I can use it after
having closed and reopened IDL?
