Hello IDL Gurus,

I would like to write a 2D array that I have [120,120], to a text file. When I write the array out now, everything appears in 1 column with 14400 rows:

```
for i = 0,119 do begin
  for j = 0,119 do begin
    PRINTF,lun,array[i,j]
  endfor
endfor
```

Is there anyway that I can format my PRINTF to print 120 columns and 120 rows, for viewing in Excel. Any ideas?

Thanks,
Vikram
