
Subject: How to distinguish widget ID and handle ID?

Hi,

I have a simple question and would appreciate it if any of you can give me a clue.

In IDL version 4, when you create widgets and handles, the IDs of widgets and handles *all* start from 1 (as long integers). Now when you pass these kind of IDs into subroutines, how can you tell if a passed in long integer is a widget ID or a handle ID?

Thanks,

Liyun
