Subject: Getting too many resize events

Hi,

I can capture widget re-size events using the TLB_SIZE_EVENTS
keyword with WIDGET_BASE. However, after you resize the
widget, IDL seems to generate these resize events again
whenever the widget is moved or exposed as well as resized.
Why is this and how can I stop it?

I am running IDL 4.0.1 on VMS from an xterm.

Thanks for any ideas,

Maurice.
