Thanks Liam ! The routines are very helpful and now I am able to retrieve all datasets. But I am still missing information about the structure of the HDF-File. I do not know which variable is stored in which VGroup. As I can see this information is not stored as an individual attribute for each variable, so I need the linkage coming from the VGroups ? Also I do not know if there is also an internal hierachy of VGroups like in the CloudSAT files.

Do you have any ideas about that ?

Thanks for your help !

Klemens
