Hello together,

I am struggling with reading VData from a VGroup in an HDF4-File  
(CloudSat-Data).

I get the number of entries in the VGroup by HDF\_VG\_GETINFO and then  
try to loop over all entries.

From there on it is not clear to me how to get first the IDs of the  
group and then to retrieve attributes and data.

I tried using HDF\_VD\_GetID and HDF\_VD\_ATTACH but it is not clear to me  
how to derive the IDs of the VData from the VGroup.

Thanks for your help in advance !

Klemens
