Hi all,

I made an IDL GUI application in which the widgets are destroyed and created (all under the same widget_base) depending on the actions of the user. On Windows this works but on linux it takes forever to rebuild the new GUI (adding buttons, tables, text_widgets, etc.). Is there a way to speed this up? Is it an IDL thing or a Linux thing?

Red Hat Enterprise Linux WS release 4 (Nahant Update 4)

{ x86_64 linux unix linux 7.0 Oct 25 2007 64 64}

Thanks,

Wout
