Hi guys,

I've a question related to Hershey Fonts. I'm trying to write a string using the character 14x16 of the Simple Greek font and I can't do it. Actually, I never understood how to access to all of this characters. Normally, I use the command to change the font !3, !4, !5, etc. and then I try some characters in order to obtain what I want.

So now, I can't find this character and I don't know how to write it.
Can anybody help me ?

Thanks,
nata
