Hi,

i am making a plot as follows:

```
plot,x,y,psym=10,yr=[1.d-8,1.],/ylog
```

and the graduation does not appear on the y axis whereas it does when i change the y range:

```
plot,x,y,psym=10,yr=[1.d-6,1.],/ylog
```

So, does anybody know how i can fix this? and for the first case, how could i read the y axis, that's to say even if the graduation does not appear, is it still a log scaling?

Thanks a lot!
