Hi all

I have a .roi file defining each county in Japan as a ROI. Now I need to designate the population of each county to every pixel within its ROI.

I had gone through the ROI related threads on this group, and still can't come up with a rigid idea about how to do this. The last way I will try is to read the line and sample numbers of each pixel in the ASCII file output from ENVI and set the value for them. Is there a smarter way to do the job? Any suggestion will be very helpful.

David, Hsu
