
Subject: Sunview to Xview conversion

We just recently upgraded from pv-wave version 2.1, running under Sunview, to version 4.01, under Xwindows.

We have a bunch of procedures written for the older version which use Sunview to create windows, menus, sliders, buttons, etc. Now our problem is to convert those procedures so they can run under the new version. Basically, we need to convert Sunview functions like "icon_create" to something similar in Xview.

There is a program called "convert_to_xview" that would translate most of this functions, but not all. Has anyone had to face a similar problem? We have an interface program written in "C" that interfaces the pv-wave procedures with Sunview. I'm trying to modify the program so it interfaces the same procedures and Xview..

Any suggestions welcome.

Martin
