Subject: Function as variable issue but in own file
Posted by rdh on Fri, 13 Nov 2009 23:03:51 GMT

Hello all -

I'm getting the error "Variable is undefined: foobar" for one of my
functions when I save and run my program as a standalone .sav file.
Everything works fine directly in IDL. The function is in it's own
file called foobar.pro. I thought this was supposed to resolve any
compile issues....I also run resolve_all before saving the standalone
file.   And, when checking the compile output, foobar.pro is actually
compiled before all the procedures and functions that call it. What
else am I missing?

thanks for the help,
Romy
