This is an old problem. It seems that renaming /usr/lib/gio/ to
/usr/lib/gio_backup/ or whatever is enough... gio is not used by
Eclipse, but it is part of a sub-sub-sub function call in a library that
  IDLDE uses... well, anyways, just rename it and the problem goes away!
Otherwise, you will have these error messages each time you start idlde,
without any consequences.

Jean
