I'm having trouble using the resolve_routine procedure as the documentation for this is very sparse. IDL complains that the function/procedure that I'm trying to compile from inside a procedure is undefined! And of course it is undefined - it isn't compiled yet...

The syntax as described in the documentation is:

```
resolve_routine, NAME, [/IS_FUNCTION]
```

I'm not sure what the NAME (a string or string array) actually has to be i.e. a path and filename or only a filename in the IDL path. The resolve_routine works fine with the IDL library procedures, but I fail to detect the difference between these and my own procedures. The documentation claims that it works with user-written procedures, so.... I would be most grateful if someone could help me with this problem.
