
Subject: {x,y}size, scale_factor, and window size

PV-Wave 3.02, SunOS 4.1.1, SS2.

I have a window on the screen which I capture with a tvrd command into a byte array. Then I change device to postscript and print the screen image.

Can somebody explain to me the relationship between xsize, ysize, and scale_factor, in the device command, and window size? It seems to me that some strange non-linear relationship exists which makes it impossible to predict the resulting postscript output size from a given window size. It definitely doesn't seem to behave as the manual says.
