Hi,

I have 3 arrays, a zenith angle array, a azimuth angle array and DN values. each DN is related to specific zenith and azimuth. I need to draw a contour of DNs on polar plot which is a circle as the distance from the center of the circle is zenith and distance from North is azimuth . I assume there should be a .pro file or sth that does this work. I used polar_contour but I think I need to add other commands to get the desired results.

any help would be appreciated.
