I'd like to generate 16-bit greyscale videos to retain the full sensor

fidelity and be able to replay them on the standard (free) video players. Is this possible in IDL 6.0?

I'm thinking with medical and infra red imaging, high quality imaging sensors, and processing power 16-bit greyscal video should be doable now without too much difficulty. Does anyone have any suggestions about how to go about generating and displaying 16-bit video.

many thanks, Neil
