Use TeXtoIDL. It will work for iPlot as well if you set the direct graphics device to PS (very much the same as with David's Greek function).

```
iplot,findgen(10),xtitle=textoidl("\Omega\alpha km^2  
ln_2'),xtickfont_index=4
```

Note that the super- and sub-scripts only work for the next character, and no (unlike TeX), {} won't help.
