Subject: concatenating arrays, stored by a pointer array
Posted by simona bellavista on Mon, 18 Jan 2010 17:38:31 GMT

Hi,
I have a generic number of arrays (N) that have been stored in a
pointer array(p):

*p[0] -> [array0]
*p[1] -> [array1]
 ...
*p[i] -> [arrayi]
...
*p[N-1] -> [arrayN-1]

each array has a different size, that's why I have used pointers. I
would like to concatenate these arrays without using for-cycles.
Naively I would say

big_array=[*p[*]]

but it doesn't work.

Any hint?
Many thanks,
simona
