
Subject: specifying argument using a variable

(OK, I know that's not the clearest subject line)...

`hdf_vd_get, vdataID, interlace=interlace`

(where interlace is either 'FULL_INTERLACE' or 'NO_INTERLACE')

`result = hdf_vd_read(vdataID, vdata, ...)`

where ... can be /FULL_INTERLACE or /NO_INTERLACE

What's the "idl way" to use the output from the `hdf_vd_get` as the input to `hdf_vd_read`?

Clearly one could do (pigeon-idl)

```
if interlace = FULL_INTERLACE then
  result=hdf_vd_read(vdataID,vdata,/FULL_INTERLACE)
else
  result=hdf_vd_read(vdataID,vdata,/NO_INTERLACE)
endif
```

But that just feels wrong... There must be a better way.

Bruce
